REPLY BRIEF

Mail Stop Appeal Brief-Patents Commissioner for Patents P. O. Box 1450 Arlington, VA 22313-1450

Dear Sir:

In response to the Examiner's Answer of February 1, 2006, Appellant submits this Reply Brief as permitted by 37 C.F.R. § 41.41. A Notice of Appeal was filed on June 3, 2005. The Commissioner is authorized to charge any deficiency or credit any excess in these fees to Deposit Account No. 13-1130.

Page 2

ARGUMENT

I. FIRST GROUND OF REJECTION – CLAIM 1 UNDER 35 U.S.C. § 102(b) OR UNDER 35 U.S.C. § 103(a)

The Examiner erred in rejecting claim 1 under 35 U.S.C. § 102(b) as anticipated by, or in the alternative, under 35 U.S.C. § 103(a) as being obvious over U.S. Patent No. 5,476,911, issued to Morini et al. Claim 1 is a product-by-process claim. Morini teaches a composition of matter, namely crystalline propylene polymers that, among other attributes, have a melt flow rate (MFR) ranging from 600 to 2,000 g/10 min (grams per ten minutes) produced by the polymerization in the presence of a catalyst. This is not the product claimed by Appellant in claim 1. Appellant's product as described in claim 1 is a spunbond fabric produced from ultra-low viscosity polypropylene polymeric resin filaments having an MFR ranging from 350 to 750 g/10 min at 230 degrees Celsius. Due to the filament speed, which is greater than 4,000 m/min (meters per minute), the filaments of Appellant's spunbond fabric have fine diameters of 0.2 dpf (denier per filament) or lower. See page 3 of Appellant's specification. The Morini reference does not claim or describe a spunbond fabric comprised of ultra-low viscosity polypropylene polymeric resin filaments having these properties. Moreover, the Examiner has failed to show that the Morini reference teaches a spunbond fabric made from ultra-low viscosity polypropylene polymeric resin filaments with these specific properties, i.e., having an MFR ranging from 350 to 750 g/10 min at 230 degrees Celsius. Thus, the Morini reference does not describe or claim the use of the spunbond process that is taught in Appellant's invention that references high speed spinning above 4,000 m/min to achieve a non-woven spunbond fabric that is extremely soft yet

Serial No. 09/778,454

Page 3

strong. For these reasons, the Examiner's rejection of claim 1 under 35 U.S.C. § 102(b) and 35

U.S.C. § 103(a) cannot be sustained.

Appellant's claimed product is a spunbond fabric, which is comprised of ultra-low

viscosity polypropylene polymeric resin filaments having an MFR ranging from 350 to 750 g/10

min at 230 degrees Celsius, that has not been found in the prior art by the Examiner. The product

described and claimed by the Morini reference is not remotely similar to Appellant's claimed

product. In column 1, lines 15-20, Morini refers generally to spun-bonded processes. However,

this reference in Morini conveys no information or teaching of Appellant's claimed spunbond

fabric, but rather is a broad, general reference to the process without any factual description of

the product made by the process. In column 3, lines 25-30, Morini refers vaguely to "fast

spinning processes." This reference to fast spinning processes does not describe Appellant's

claimed spunbond fabric. The Examiner's rejection under 35 U.S.C. § 102(b) is without any

legal or factual basis to show anticipation. Each and every element of Appellant's claimed

invention is not expressed, suggested, or implied in Morini. The Examiner seeks an alternative

rejection of Appellant's claim 1 under 35 U.S.C. § 103(a) as being obvious over Morini. Under

Graham v. John Deere Co., 383 U.S. 1, 148 U.S.P.Q. 459 (1966), which set forth the

requirements for claim rejections under 35 U.S.C. § 103(a), the Examiner's rejection has no basis

in law or in fact. The scope of the prior art cited is not relevant to Appellant's spunbond fabric

as claimed in claim 1. In reviewing the Morini reference, a person of ordinary skill in the art

would be in the dark as to the composition of and how to create the spunbond fabric Appellant

describes in claim 1.

Serial No. 09/778,454

Page 4

Finally, the Examiner boldly discards an important step in the product by process for treating PP and cavalierly suggests that the claimed spunbond spinning rate step of 4,000 meters/minute will not be considered. Appellant's reply is straightforward- read Appellant's specification to understand the invention. There is no legal basis for the Examiner to disregard a claimed step in Appellant's product-by-process invention of claim 1. The structure implied by the process should be considered in reviewing the patentability of a product-by-process claim. Appellant's claim 1 asserts "excellent softness and strength" in the spunbond fabric. See In re Garnero, 412 F.2d 276, 279, 162 U.S.P.Q. 221, 223 (C.C.P.A. 1979).

SECOND GROUND OF REJECTION – CLAIM 7 UNDER 35 U.S.C. § 102(b) OR II. UNDER 35 U.S.C. § 103(a)

The Examiner erred in rejecting claim 7 under 35 U.S.C. § 102(b) as anticipated by, or in the alternative, under 35 U.S.C. § 103(a) as obvious over WO 96/29460, issued to Bailey et al. As stated in one element of Appellant's claim 7, the polyethylene resin filaments of Appellant's spunbond fabric have an MFR of 250 to 750 g/10 min at 230 degrees Celsius. Appellant's claimed product is a spunbond fabric having excellent softness barrier and air breathability. To sustain an anticipation rejection under 35 U.S.C. § 102(b), the Examiner is required to demonstrate "the presence in a single prior art reference disclosure of each and every element of the claimed invention, arranged as in the claim." Lindemann Maschinenfabrik GmbH v. American Hoist and Derrick, Co., 730 F.2d 1452, 1458 (Fed. Cir. 1984); see also W.L. Gore & Associates, Inc. v. Garlock, Inc., 721 F.2d 1540, 1554 (Fed. Cir. 1983). The Bailey reference does not disclose each element of claim 7, and therefore, does not anticipate the Appellant's

Serial No. 09/778,454

Page 5

invention. For example, the Bailey reference states that the most preferred MFR for linear low density polyethylenes is "above 60 grams per 10 minutes (at 190° C)." See Bailey et al., page 11, lines 7-10. However, Bailey describes the fabric claimed and described in U.S. Patent No. 5,173,356 ("the '356 Patent") as the preferred form of fabric providing an adhesive binder for A review of the '356 Patent completely contradicts the Examiner's position. carpeting. Specifically, the non-woven fabric described in the '356 patent has an MFR that does not exceed 80 g/10 min. See the '356 Patent, column 8, lines 41-48. The MFR described and claimed in the '356 Patent is much lower than that required by Appellant in claim 7, and therefore, the product described in Bailey differs from Appellant's claimed product. Thus, the Examiner's rejection of claim 7 under 35 U.S.C. § 102(b) cannot be sustained.

Concerning the alternative obviousness rejection, the Examiner's reliance on In re Thorpe, 227 U.S.P.Q. 964, 966 (Fed. Cir. 1985), is erroneous. The Bailey reference does not teach the product that is claimed in Appellant's claim 7. None of the prior art cited by the Examiner teaches a product that is claimed in claim 7. In fact, the '356 Patent incorporated by reference by Bailey teaches away from Appellant's invention using completely different melt flow rates. The Examiner bases his rejection on the precedent of In re Thorpe, stating on page 4 of the Answer Brief that: "The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same or an obvious variant from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process." The Examiner has taken a per se rule from the Thorpe case, that different processes do not make a product patentable, and has applied the per se rule to reject Appellant's

Serial No. 09/778,454

Page 6

claims. "[T]here are not [Thorpe] obviousness rejections. . . but rather only section 103 obvious rejections" in which facts in the record must support a legal conclusion of obviousness. Ex parte Johnson, 1997 WL 1941498 (Bd. Pat. App. & Interf. 1997). In Exparte Johnson, the Board held that its "precedents do not establish any per se rules of obviousness, just as those precedents themselves expressly declined to create such rules." Id. The decision of the United States Supreme Court in Graham v. John Deere Co. of Kansas City, 383 U.S. 1, 17 (1966), and 35 U.S.C. § 103 both require a fact-specific analysis of the Applicant's claims and the prior art to determine obviousness. Id.; Graham v. John Deere Co. of Kansas City, 383 U.S. 1 (1966); 35 U.S.C. § 103. In the present case, the Examiner has forgone the laborious fact-specific analysis of the claims compared to the teachings of the prior art reference and has rejected claim 7 on the basis of a per se rule taken from the In re Thorpe case. The Examiner also fails to determine and discuss the skill of a person of ordinary skill in the art. Clearly, claims rejections based upon per se rules gathered from judicial precedent are not permissible as the fact-specific analysis of an applicant's claims against the disclosures of the prior art is an indispensable prerequisite to a finding of obviousness under 35 U.S.C. § 103. The Examiner's rejection of claim 7 is clearly erroneous. To demonstrate obviousness under 35 U.S.C. § 103, the reference must teach or suggest the combination. In re Geiger, 815 F.2d 1276 (Fed. Cir. 1987). For these reasons, the Examiner's rejection of claim 7 for obviousness cannot be sustained.

Serial No. 09/778,454

Page 7

III. THIRD GROUND OF REJECTION – CLAIM 3 UNDER 35 U.S.C. § 102(e) OR UNDER 35 U.S.C. § 103(a)

The Examiner erred in rejecting claim 3 under 35 U.S.C. § 102(e) as anticipated by or, in the alternative, under 35 U.S.C. § 103(a) as obvious over U.S. Patent No. 6,548,431, issued to Bansal et al. Appellant's invention is not anticipated by the Bansal reference. Appellant uses only polyethylene terephthalate resins with intrinsic viscosity of less than 0.55 dl/g to form the extruded filaments comprising the spunbond fabric of Appellant's invention as described in claim 3. The Bansal reference teaches away from Appellant's invention by describing and claiming a melt spun sheet comprised of multiple component filaments. See Bansal et al., column 2, lines 38-41; column 3, lines 7-15; column 11, lines 38-59; column 12, lines 14-24; claim 12; and claim 13. Specifically, the Bansal reference uses two separate polymers to create a single filament. In Appellant's claim 3, polyethylene terephthalate is the only component utilized in the extruded filaments comprising the spunbond fabric. The Bansal reference does not teach or suggest the use of a single resin filament of low viscosity to make a spunbond fabric. Appellant has discovered the claimed product with a spunbond process using a single polymer to create a filament for use in producing spunbond fabrics having excellent softness, strength, barrier properties, and air breathability. Because claim 3 uses the word "consisting," the reference cannot be prior art as to anticipation. Therefore, the Examiner's rejection of claim 3 under 35 U.S.C. § 102(e) cannot be sustained.

Further, the Examiner's rejection of claim 3 under 35 U.S.C. § 103(a) of obviousness is clearly negated by the fact that the reference teaches that you must use a combination of polymers

Serial No. 09/778,454

35 U.S.C. § 103(a) cannot be sustained.

Page 8

for each single filament created. A person of ordinary skill in the art would not arrive at Appellant's claimed product reviewing the Bansal reference. Appellant's invention is not obvious in light of Bansal because the reference teaches away from Appellant's claimed spunbond fabric. "A reference may be said to teach away when a person of ordinary skill, upon reading the reference, would be discouraged from following the path set out in the reference, or would be led in a direction divergent from the path that was taken by the applicant." In re Gurley, 27 F.3d 551, 553 (Fed. Cir. 1994). In considering the disclosure of the Bansal reference, one of ordinary skill in the art would not be led in the direction of the teachings of the Appellant's invention but would be led in direction that diverges from the path taken by the Appellant. The Federal Circuit, in an unpublished opinion, has found that one of ordinary skill in the art would not be motivated to combine prior references where one of the cited references teaches away from the combination advanced by the Examiner. In re Rudko, Civ. App. No. 98-1505 (Fed. Cir. May 14, 1999) (unpublished). Thus, the Examiner's rejection of claim 3 under

IV. FOURTH GROUND OF REJECTION – CLAIM 5 UNDER 35 U.S.C. § 103(a)

The Examiner erred in rejecting claim 5 under 35 U.S.C. § 103(a) as unpatentable over U.S. Patent No. 5,688,468, issued to Lu, in view of U.S. Patent No. 6,268,302, issued to Ofosu et al. Appellant has incorporated the Lu reference into the specification on page 3, lines 7-8. The Lu patent does not teach the use of an ultra-low viscosity polymeric resin. Moreover, in column 5, lines 38-51, the Ofosu reference specifically limits the melt flow rate between 50 g/10 min and 150 g/10 min at a defined temperature. Clearly, the combination of the Ofosu reference with the

Serial No. 09/778,454

Page 9

Lu reference does not produce Appellant's claimed invention as described in claim 5. Appellant has used an ultra-low viscosity resin (the polyamide PA6 nylon 6) not suggested in Ofosu in conjunction with generating filament speeds above 4,000 meters per minute. The Examiner relies upon In re Boesch, 617 F.2d 272, 205 U.S.P.Q. 215 (C.C.P.A. 1980), in stating that Appellant's invention is obvious where the discovery of an optimum value of a result effective variable involves only routine skill in the art. The range of constituents claimed in the Boesch case was overlapped by ranges found in the prior art. In In re Boesch, the prior art was silent as to a signal-like phase present in the composition. With respect to claim 5, the relative viscosity of Appellant's invention is completely different than the result effective variable teaching in the Boesch case. In the present case, there is no overlapping of claimed values and, in fact, the viscosity values disclosed in Ofosu are significantly different and lower than the relative viscosity values claimed by Appellant in claim 5. The Examiner is erroneously using hindsight to arrive at Appellant's claimed invention. In re Rouffet, 149 F.3d 1350, 47 U.S.P.Q.2d 1453 (Fed. Cir. 1998).

Hindsight reconstruction may not be used to cobble together various elements of an invention that are cited in prior art references to support a rejection based upon obviousness under 35 U.S.C. § 103(a). The Federal Circuit has determined that "[i]t is impermissible to use the claimed invention as an instruction manual or 'template' to piece together the teachings of the prior art so that the claimed invention is rendered obvious." In re Fritch, 972 F.2d 1260, 1266 (Fed Cir. 1992). In rejecting claim 5, the Examiner has done just that; that is to say, the Examiner has used the Appellant's claim as a template to stitch together teachings from the prior

Serial No. 09/778,454

Page 10

art to find the Appellant's invention obvious under 35 U.S.C. § 103(a). None of the prior art references cited by the Examiner contains any suggestion to modify the inventions described by the Lu and Ofosu references in the manner set forth by the Examiner.

The Examiner has taken a per se rule from In re Boesch, 617 F.2d 272 (C.C.P.A. 1980), that discovering an optimum value of a result effective variable involves only routine skill in the art, and has applied the per se rule to reject Appellant's claim 5. "[T]here are not [In re Boesch] obviousness rejections. . . but rather only section 103 obvious rejections" in which facts in the record must support a legal conclusion of obviousness. Ex parte Johnson, 1997 WL 1941498 (Bd. Pat. App. & Interf. 1997). In Ex parte Johnson, the Board held that its "precedents do not establish any per se rules of obviousness, just as those precedents themselves expressly declined to create such rules." Id. The Graham v. John Deere Co. of Kansas City, 383 U.S. 1, 17 (1966), case and 35 U.S.C. § 103 require a fact-specific analysis of the Appellant's claims and the prior art to determine obviousness. Ex parte Johnson, 1997 WL 1941498 (Bd. Pat. App. & Interf. 1997); Graham v. John Deere Co. of Kansas City, 383 U.S. 1, 17 (1966); 35 U.S.C. § 103. In the present case, the Examiner has forgone the laborious fact-specific analysis of the claims compared to the teachings of the prior art reference and has rejected claim 5 on the basis of a per se rule taken from the Boesch case. "Rejections based on 35 U.S.C. § 103(a) must rest on a factual basis," and "[i]n making such a rejection, the examiner has the initial duty of supplying the requisite factual basis and may not, because of doubts that the invention is patentable, resort to speculation, unfounded assumptions or hindsight reconstruction to supply deficiencies in the factual basis." Ex parte Makutonin, 2003 WL 23014547 (Bd. Pat. App. & Interf. 2003); In re

Serial No. 09/778,454

Page 11

Warner, 379 F.2d 1011, 1017 (C.C.P.A. 1967). Clearly, claims rejections based upon per se

rules gathered from judicial precedent are not permissible as the fact-specific analysis of an

applicant's claims against the disclosures of the prior art is an indispensable prerequisite to a

finding of obviousness under 35 U.S.C. § 103. For these reasons, the Examiner's rejection of

claim 5 under 35 U.S.C. 103(a) cannot be sustained.

V. FIFTH GROUND OF REJECTION – CLAIM 8 UNDER 35 U.S.C. § 103(a)

The Examiner's rejection of claim 8 under 35 U.S.C. 103(a) as being unpatentable over

W.O. 96/29460, issued to Bailey et al. As discussed in section II above, in which Bailey was

cited as a reference in the Examiner's rejection of claim 7, Appellant reiterates the statements

made in section II in response to the rejection of claim 8. Dependent claim 8 claims the creation

of a multiple layer fabric consisting of layers of the filaments of the resins that were produced in

claim 7. In Bailey, Appellant's claimed melt flow rates between 250 and 750 g/10 min that are

required in Appellant's independent claim 7 and dependent claim 8 are not suggested in a

product produced through spunbonding as required in claim 7. A person skilled in the art could

review the Bailey reference thoroughly and would not find as obvious the claimed invention in

Appellant's dependent claim 8.

Appellant's claim 8 depends upon independent claim 7, and thus, incorporates by

reference all of the elements and limitations of independent claim 7. 35 U.S.C. § 112, fourth

paragraph. On page 7 of the Answer Brief, the Examiner acknowledges that the Bailey reference

does not teach that "the spunbonded fabric can be a multiple layer fabric consisting of layers of

the filaments of the same resins" as is disclosed in Appellant's claim 8. Moreover, Appellant's

Serial No. 09/778,454

Page 12

novel and unknown properties of the claimed spunbond fabric, i.e., the extruded polyethylene

resin filaments (of which the spunbond fabric is comprised) having a melt flow rate between 250

and 750 g/10 min at 230 degrees Celsius, which are described in independent claim 7, are

included as part of the limitations of claim 8. Therefore, it would not have been obvious to one

of ordinary skill in the art to choose the particular extruded polyethylene filaments invented by

Appellant as a part of the multiple layer fabric in dependent claim 8 for the simple reason that the

particular extruded polyethylene filament having an MFR between 250 and 750 g/10 min at 230

degrees Celsius was unknown but for Appellant's disclosure in the application. "[O]ne cannot

choose from the unknown." In re Ochiai, 71 F.3d 1565, 1570 (Fed. Cir. 1995), citing In re

Mancy, 499 F.2d 1289, 1293 (C.C.P.A. 1974). For the foregoing reasons, the Examiner's

rejection of claim 8 under 35 U.S.C. § 103(a) is erroneous and cannot be sustained.

Respectfully submitted,
